

KeyGen

(for amplified wind and strings)

David Cecchetto, 2008

Performance Guidelines

All Instruments:

 Vertical dotted lines (which are sometimes rendered in grey to preserve the clarity of the score) indicate sync points between ensemble members.

Where shapes are present, the material is unpitched. In the saxophone and tuba, these shapes always indicate an air sound; in the violin and contrabass, the shapes should be articulated with the technique indicated. The shapes themselves are indicative of dynamics.

 A rectangle, for example, indicates a steady dynamic. Dynamics should always be understood as being in quotation marks, so that a ‘ff’ air sound in the Tuba refers to the intensity of attack rather than an actual sound level.

 indicates ‘gradually change to’; for example “CLT  1/2 hair” indicates a gradual change in bowing from wood only to 1/2 hair.

→ Straight horizontal arrows should be read as ‘continue until’; for example, the arrow in the electronics part on the first page of the score indicates that the initial ensemble amplification should be sustained (through the commencement of the Record command) until ‘amplification off.’

Saxophone:

S.T. indicates sub-tone, and should strongly emphasize the air quality of the pitch

Unpitched air should always be blown through the saxophone with either all keys open (indicated ‘+’) or all keys closed (indicated ‘o’).
Note: **in Section 6 only**, x-shaped noteheads are used to indicate air sounds

 Triangle-shaped noteheads indicate a ‘slap tongue’ attack, where the resulting sound is more percussive than pitched in character. The technique is matched by the strings ‘slap’ pizzicato.

Tuba:

Text in quotations (i.e. “sh” or “p”) indicates the consonant sound with which the air sound should be attacked. These attacks are always unpitched. Where “air only” is indicated, no consonant sound should be used.

 Triangle-shaped noteheads indicate a ‘pop’ attack, achieved largely with the lips, where the resulting sound is more percussive than pitched in character. The technique is matched by the strings ‘slap’ pizzicato.

Strings:

Where bowing on the bridge is indicated, players may choose to ‘bow diagonally’ in order to ensure that the desired effect is achieved.

Instructions are given in the following order: attack technique, attack placement, string; for example, “wood only, on bridge, III” indicates that the player should play with only the wood of their bow on the bridge over the third string.

 indicates that the performer should scrape the string. Where time permits, this should be done using a nickel as a plectrum, but it may also be performed with either the frog or the metal pad. The direction of the arrow indicates the direction of the scrape relative to the performer’s shoulder, with an upwards arrow moving away from the shoulder. Note that, as a result, an upwards pointing arrow in the Violin will have a parallel contour to a downwards pointing arrow in the Contrabass.

MST indicates ‘molto sul tasto’ and should be bowed as far from the bridge as possible (while still sounding the indicated pitch).

Unmeasured tremolos () should be bowed as fast as possible.

CLT indicates *col legno tratto*, and is to be played with 100% wood.

CLB indicates *col legno battuto*, and should always be played with a ricochet technique ()

 Diamond-shaped noteheads indicate that the note is to be played as a scratch tone. The pitch indicates the note that is to be fingered; the resulting note will not be recognizably pitched.

 Square noteheads indicate that the performer should knock (with their knuckles) on the instrument; on the bottom of the violin, and on the side of the contrabass.

 Triangle-shaped noteheads in the strings indicate a slap pizzicato; the pitch should be less discernible than the percussive aspect (as in a ‘Bartok pizz’).

 **in Section 6 only**, this right-angle triangle notehead is used to indicate bowing on the bridge. As noted above, the performer may choose to bow diagonally across the bridge to avoid a discernible pitch.

Electronics:

The indicated amplification levels should be understood as relative guidelines only. As a guideline, the amplified sections should not be louder than the loud acoustic sections, and should be a similar volume to the pre-recorded material.

Continuous lines indicate a change in the panning of the electronics (as in Sections 2b and 3).

Initial Performance Layout

Note 1: There should be at least 20’ separating the performers and the loudspeakers; the loudspeakers themselves should be situated as close as possible to the audience, without the ‘ensemble centre’ pan setting sounding like two discrete channels.

Note 2: All lights in the space should be turned off, with the exception of musicians’ stand lights and the audience area light.
